

Australian Rollforming Manufacturers (ARM) supplies 5 km of Conveyor Frames to the Goro Nickel mine site in New Caledonia.

5 kilometres of conveyor sections were rollformed from hi-tensile galvanised steel coil in ARM's factory in Dandenong, Victoria

Each channel section was pre-punched and incorporates a stiffened top lip and plain bottom flange to minimise moisture and dirt retention

After punching and rollforming, the frames, along with the fasteners, mounting bolts and brackets, were assembled in modules

The modules were supplied as a complete package resulting in significant savings in terms of transport costs, handling and on-site erection costs

17 container loads of pre-assembled modules were delivered on time to the mine site against a very demanding delivery schedule
